## Positioning Systems

Linear Axes KK/KF

## Positioning Systems

### Linear axes with ballscrew

Linear axes are used in many areas of industry to transport or to position. HIWIN supplies linear axes with ballscrews for a range of applications. The liner axes of the KK and KF series are particularly suitable for applications requiring high feed forces and precision in combination with high rigidity.

# KK/KF Linear Axes

## General information

### 2. General information

#### 2.1 Characteristics of KK/KF linear axes

HIWIN KK/KF linear axes are compact positioning axes with high feed forces. High levels of accuracy and rigidity are achieved through a linear guideway in the steel profile with integrated ballscrew.

The axis is available in different sizes and lengths and can be adapted to the application requirements through additional options such as aluminium covers, bellow covers, limit switches and additional blocks.

#### Typical properties

- Ready-to-install complete axis
- Universal use
- Compact design
- Adaptable and robust
- High precision and rigidity

#### Advantages KK axis

- Double row version
- Standard version
- Horizontal installations possible
- Vertical installations possible with suitable clamping or braking device
- Application with high accuracy
- Compact design

#### Additional advantages KF axis

- Four row version
- Optimised synchronisation characteristics
- Reduced running noise
- Same dimensions as KK axis
- SynchMotion™ technology

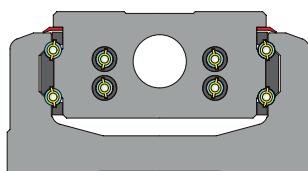

Fig. 2.1 4-row linear axis KF

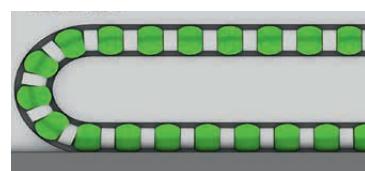

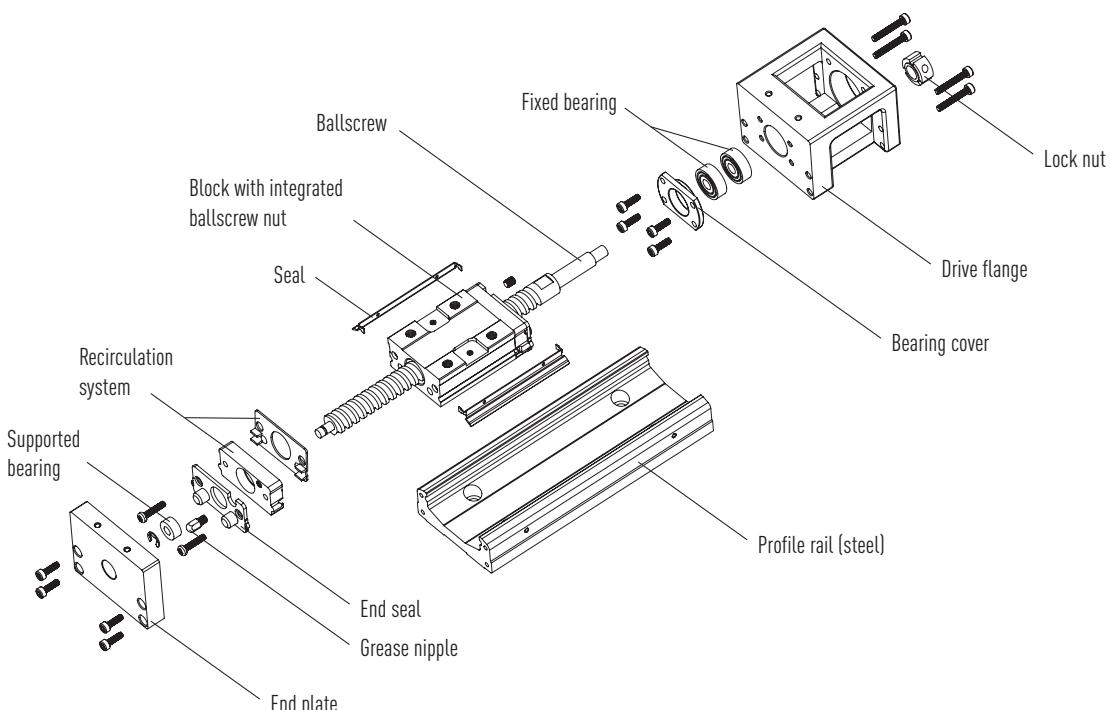

Fig. 2.2 SynchMotion™ technology

#### 2.2 Structure of KK/KF linear axes

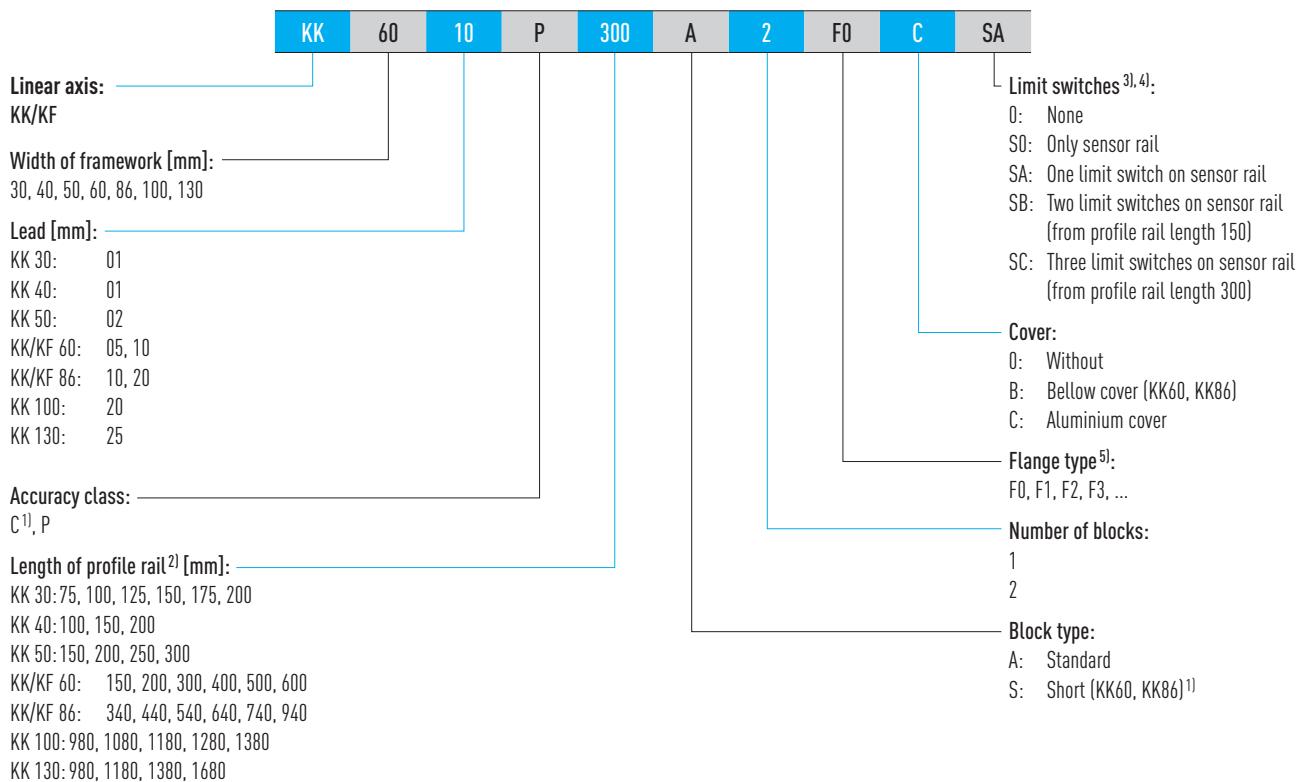

#### Speciality KK axis

- Double row version
- Full spherical

#### Speciality KF axis

- Four row version
- SynchMotion™ technology

### 2.3 Order code for KK/KF linear axes

<sup>1)</sup> On request

<sup>2)</sup> Shortened lengths are available on request

<sup>3)</sup> Not available for model KK30

<sup>4)</sup> Limit switches are normally closed contacts, normally open contacts are available via accessories

<sup>5)</sup> The suitable flange type for adapting the HIWIN servomotors EM1 can be found in section 12.5

# KK/KF Linear Axes

## General information

### 2.4 Service life calculation

The repeated load on blocks and spindles results in signs of fatigue and eventually pitting on the track surface. The service life of a linear axis is defined as the total distance travelled until pitting appears on the surface of the track or spindle.

#### 2.4.1 Nominal service life (L)

The service life may vary significantly even between linear axes that were manufactured in the same way and are used under the same motion conditions. So the nominal service life serves as a guideline to estimate the service life of a linear axis. The nominal service life corresponds to the total distance travelled that will be achieved by 90 % of a group of identical linear axes used under the same conditions without failure.

##### Calculation of nominal service life (L)

The actual calculation influences the nominal service life of a linear axis. When the selected dynamic load rating and the dynamic equivalent load are known, the nominal service life can be calculated using the formulas F 2.1 and F 2.2.

- Nominal service life of ballscrew

$$F\text{ 2.1} \quad L = \left( \frac{C_{dyn}}{f_p \times F_{xm}} \right)^3 \times 10^6$$

L Nominal service life in revolutions

$C_{dyn}$  Dynamic load rating [N]

$F_{xm}$  Dynamic equivalent load (axial) [N]

$f_p$  Ballscrew load factor

- Nominal service life of linear guideway

$$F\text{ 2.2} \quad L = \left( \frac{C_{dyn}}{f_w \times F_{bm}} \right)^3 \times 50 \text{ km}$$

L Nominal service life in kilometres

$C_{dyn}$  Dynamic load rating [N]

$F_{bm}$  Dynamic equivalent load [N]

$f_w$  Linear guideway load factor

##### Load factor ( $f_p$ , $f_w$ )

The loads that act on a linear axis include the weight of the block, the inertia at the start and end of a movement and the load torque created by the projecting load. These load factors are especially difficult to gauge when vibrations or impact loads are added. The load should therefore be multiplied by the empirical load factor. In short-stroke applications (stroke < 2 × block length) the calculated load factor should be doubled.

Table 2.1 Ballscrew load factor

Type of load	$f_p$
Operation without impact	1.1 – 1.2
Operation under normal conditions	1.3 – 1.8
Operation with high impact and vibrations	2.0 – 3.0
Short-stroke applications (< 3 × nut length)	3.0 – 5.0

Table 2.2 Linear guideway load factor

Type of load	Travel speed	$f_w$
No impact or vibrations	up to 15 m/min	1.0 – 1.2
Normal load	15 m/min to 60 m/min	1.2 – 1.5
Minor impacts	60 m/min to 120 m/min	1.5 – 2.0
With impact and vibrations	over 120 m/min	2.0 – 3.5

#### 2.4.1.1 Calculation of service life of linear guideway

Because the load of a block varies considerably, an equivalent load must be used to calculate the service life. The equivalent load is defined as the load that causes the same wear on the bearings as the variable load. Constant operating conditions are not taken into account.

- Combined dynamic equivalent load

$$F_{bm} = F + M \times \frac{C_0}{M_0}$$

This formula is a simplified way of calculating the dynamic equivalent load. If you require more information, please contact HIWIN.

#### Example calculation of service life of linear guideway

- Service life calculation for a KK60 linear axis (when  $f_w = 1$ )

Specification:	$M_y = 20 \text{ Nm}$	Moment
	$M_{y0} = 152 \text{ Nm}$	Static moment <sup>1)</sup>
	$C_{dyn} = 13,230 \text{ N}$	Dynamic load rating <sup>1)</sup>
	$C_0 = 21,462 \text{ N}$	Static load rating <sup>1)</sup>

<sup>1)</sup> For calculated values for load ratings and static moment, see Table 2.4

$$F_{bm} = F + M \times \frac{C_0}{M_{y0}} \rightarrow F_{bm} = 0 + 20 \text{ Nm} \times \frac{21462 \text{ N}}{152 \text{ Nm}} \rightarrow F_{bm} = 2823.95 \text{ N}$$

$$L = \left( \frac{C_{dyn}}{f_w \times F_{bm}} \right)^3 \times 50 \text{ km} \rightarrow L = \left( \frac{13230 \text{ N}}{1 \times 2823.95 \text{ N}} \right)^3 \times 50 \text{ km} \rightarrow L = 5141 \text{ km}$$

With a moment of  $M_y = 20 \text{ Nm}$ , the nominal service life of the block in a KK/KF60 linear axis is 5,141 km.

For more information, please contact HIWIN.

#### 2.4.1.2 Calculation of service life of ballscrew

The bases of calculation are based on DIN 69051 and/or ISO 3408. For detailed information about configuring a ballscrew, please refer to our "Ballscrews and Accessories" catalogue.

##### a) Average speed $n_m$

$$n_m = n_1 \times \frac{t_1}{100} + n_2 \times \frac{t_2}{100} + n_3 \times \frac{t_3}{100} + \dots$$

$n_m$  Average speed, total [1/min]  
 $n_n$  Average speed in phase n [1/min]  
 $t_n$  Amount of time in phase n [%]

##### b) Average operating load $F_{xm}$

- With alternating load and constant speed:

$$F_{xm} = \sqrt[3]{F_{x1}^3 \times \frac{t_1}{100} \times f_{p1}^3 + F_{x2}^3 \times \frac{t_2}{100} \times f_{p2}^3 + F_{x3}^3 \times \frac{t_3}{100} \times f_{p3}^3 \dots}$$

$F_{xm}$  Average operating load in axial direction [N]  
 $F_{xn}$  Operating axial loading in phase n [N]  
 $f_{pn}$  Operating condition factor in phase n  
 $f_p$  See Table 2.1

- With alternating load and alternating speed:

$$F_{xm} = \sqrt[3]{F_{x1}^3 \times \frac{n_1}{n_m} \times \frac{t_1}{100} \times f_{p1}^3 + F_{x2}^3 \times \frac{n_2}{n_m} \times \frac{t_2}{100} \times f_{p2}^3 + F_{x3}^3 \times \frac{n_3}{n_m} \times \frac{t_3}{100} \times f_{p3}^3 \dots}$$

# KK/KF Linear Axes

## General information

### Service life with axial load on both sides

- Service life in revolutions

$$F\ 2.7 \quad L_1 = \left( \frac{C_{dyn}}{F_{xm1}} \right)^3 \times 10^6$$

$$L_2 = \left( \frac{C_{dyn}}{F_{xm2}} \right)^3 \times 10^6$$

F 2.8

$$L = \left( L_1^{-10/9} + L_2^{-10/9} \right)^{-9/10}$$

$L_1$  Service life in revolutions, forward motion

$L_2$  Service life in revolutions, backward motion

$C_{dyn}$  Dynamic load rating [N]

$F_{xm1}$  Average operating load, forward motion [N]

$F_{xm2}$  Average operating load, backward motion [N]

$L$  Service life in revolutions

- Conversion of service life into operating hours

F 2.9

$$L_h = \frac{L}{n_m \times 60}$$

$L_h$  Service life in operating hours

$n_m$  Average speed [rpm], see formula F 2.4

$L$  Service life in revolutions

- Conversion of distance travelled [km] into operating hours

F 2.10

$$L_h = \left( \frac{L_{km} \times 10^6}{P} \right) \times \frac{1}{n_m \times 60}$$

$L_h$  Service life in operating hours

$L_{km}$  Service life in distance travelled [km]

$P$  Lead [mm]

$n_m$  Average speed [rpm], see formula F 2.4

## 2.5 Ambient conditions

- Ambient temperature: +5 °C to +40 °C
- Installation site: dry
- Atmosphere: not explosive

## 2.6 Glossary

### Positioning accuracy

According to VDI/DGQ 3441, positioning accuracy describes the maximum deviation between the actual and nominal positions. Positioning accuracy is influenced by the following factors: lead error of spindle, system play, controller parameterisation and the accuracy of the linear unit, transmission, motor and measuring system.

### Repeatability

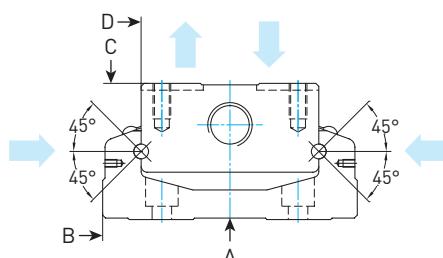

Repeatability describes how accurately the block is stopped and positioned when approaching a given position from any direction several times. It is stated as the maximum deviation between the actual positions attained.

### Starting torque

The starting torque is the torque needed to overcome the frictional torque.

### Guide parallelism

The guide parallelism is measured by aligning a measuring rule parallel to a linear axis mounted on a table. The parallelism of contact faces D and B on the block and profile and of the block top face C to mounting surface A of the profile is then measured. It is assumed that the axis is ideally installed and that the measurement is taken across the centre of the block. Guide parallelism is calculated by subtracting the minimum value from the maximum value.

**Reserve stroke**

The reserve stroke  $L_r$  equals the distance that can be travelled in addition to the stroke on both sides of the end positions (stroke 0, stroke max) before the carriage reaches the mechanical end position at the installed dampers. The reserve stroke is defined for each axis size at the factory.

The reserve stroke for each axis size can be found in the dimension tables for the individual sizes.

## 12. Accessories

### 12.1 Sensor rail with limit switch

The KK/KF linear axis can be ordered with up to three limit switches (inductive PNP proximity switches). The limit switches are mounted on the sensor rail, where they can be placed in any position. The limit switches are supplied with open cable ends and

mounted on the sensor rail which is attached to the linear axis. More details of the limit switches can be found in the "KK/KF linear axes assembly instructions" available at [www.hiwin.de](http://www.hiwin.de).

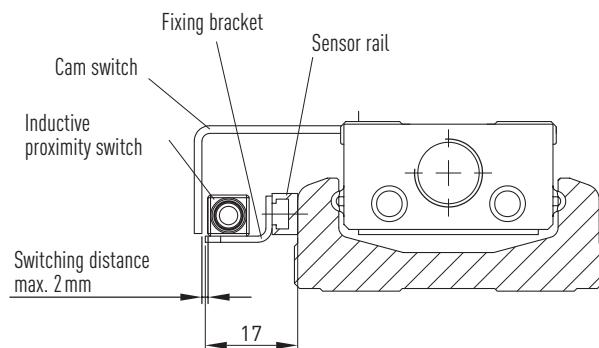

Table 12.1 Available limit switches

Article number	Function	Cable length
8-14-0040 <sup>1)</sup>	Normally closed contact	4 m
8-14-0010	Normally open contact	2 m

<sup>1)</sup> Standard version

### 12.2 Cross table adapter

- Adapter for connecting two or more KK/KF axes crosswise into one X-Y system
- Adapter for KK/KF axes available with and without aluminium cover
- Cam switch for limit switch can be adapted
- Black anodised surface
- Delivered in a set including mounting material

#### 12.2.1 Cross table adapter for KK/KF linear axes without aluminium cover
